Universal pressure moisture control

The Bannatyne Universal Pressure Moisture System helps keep moisture away from your pipe chanter reed.

One end is installed in the base of the blowstick stock. Air blown in through the blowstick is diverted to the rear of the bag and passes through a desiccant. This means that the air in the pipe bag is kept drier overall, and the chanter reed, specifically, is protected from the warmest and moistest air. In with the moisture sleeve is our tube bottle trap, helping to contain moisture.

The Universal Pressure Moisture Control system **includes** the drone controllers below.
